

GEAR COUPLINGS

MAINA GEAR COUPLINGS - INTRODUCTION

The full-flex gear couplings are employed to mechanically connect two rotating shafts which have to transmit a torque in a torsionally rigid way. The torque is transmitted from hub to sleeve and vice-versa by the working gear teeth, and between the connecting flanges of the two hubs by the set bolts.

The gear couplings are flexible to compensate the misalignment of the shafts to be connected. They compensate both the initial misalignment (support clearances, dimensional and geometrical tolerances of the equipment, alignment imperfections), and further alignment modifications (settling and support wear) and/or temperature (expansion).

The gear couplings are flexible because their working gear teeth must be able to float and slide, in order to compensate misalignments. Floating is performed by engaging outer spherical gear teeth with inner cylindrical ones, both having proper tangential clearance. The outer spherical gear teeth, olive shaped tangential section and "Semitopping" on the head, enable the gear hubs to float on their central axis, thus allowing their axial slide and the continuous lube flow, while avoiding any harmful stress concentration on the gear teeth.

The gear teeth center on their external diameters, with a proper radial clearance, so that the rotating masses do not generate any vibration when operating at low speed and transmitting torque. When the speed and/or the torque get higher, the gear teeth center on their working flanks, so distributing the load on all the teeth.

We recommend to perform a dynamic balancing of the rotating masses - grade and requirements to be specified (see AGMA 9000 C90) - in case of high rotation speed or when equipment having supports sensitive to mass imbalance are involved.

A single engagement of gear teeth (half-coupling) can compensate both angular and axial misalignments; two engagements of gear teeth (complete coupling) are required to compensate also the parallel misalignments.

Please remember that angular, parallel, axial and combined misalignments, maximum speed rotation and transmitted torques must be in accordance with the requirements of every kind of coupling, to avoid excessive or early wear. Maintenance and lubrication have to be careful and precise. Please strictly follow our **INSTALLATION, USE & MAINTENANCE INSTRUCTIONS** (see pages 54, 55, 56, 57, 58).

MAINA gear couplings are obtained from forged steel ingots, machined and heat treated. Gear couplings can be made of different types of steel, as AISI 1045, AISI 4140, Nitralloy N/135/135M which are hardened and tempered before being machined. To increase the load capacity, in some types of couplings, the gear teeth can be surface-hardened after machining by thermal or thermochemical treatments and, when required, they can be ground. Main treatments are induction tempering, nitroxidation and gas nitriding.

It is also possible to perform antioxidant and anticorrosive treatments in the end stage.

We can perform a nitroxidation (N.O.) treatment on our standard GO-A gear couplings made of AISI 1045, when required. Besides limiting surface corrosion, this treatment improves surface hardness and wear resistance, and increases working gear teeth lifetime even in presence of high misalignments and rotation speeds.

Unless otherwise required, our gear couplings are properly packaged, according to their dimensions, weight, required type of transport and storage. To prevent oxidation, the interface surfaces or the surfaces which have to be submitted to assembly operations are usually protected by a wax film of TECTYL 506 EH. The raw (semifinished) and wide surfaces of spacer tubes are painted, after sandblasting, by one primer acrylic coat and two final epoxy coats; this kind of painting can resist at temperatures up to 100-120°C.

Different types of coatings can be applied on demand.

The torque a gear coupling can transmit as well as its maximum operating speed change according to the total misalignment between the shafts to be connected (see diagrams of speed factor K_v and of load factor K_i , shown on pages 02, 03, 04 and 05).

The gear couplings must be selected according to the operational data (load and speed), the application, the nominal and max load capacities, the nominal speed, the static and dynamic misalignments and the max admitted bore.

This catalogue shows the main types and designs of flex gear couplings employed in the machinery manufacturing; it does not contain all the possible different designs.

For special solutions, not included in this catalogue, please contact MAINA.

LIST OF COMPONENTS

01	Standard Hub
02	Flanged Sleeve
03	Set Screw
04	Hexagonal Self-locking Nut
05	Seal Gasket
06	Longer Hub
07	Lube Fitting or Lube Plug
08	Removable Side Flange
09	Tubular Spacer
10	Rigid Hub
11	Floating Shaft

TECHNICAL DATA

GO-A, GO-B, GO-B.HT & G20 COUPLINGS

LOAD DATA:

P	= ABSORBED AND/OR INSTALLED POWER	[kW]
n	= OPERATING SPEED	[1/min]
KS	= OVERLOAD FACTOR	[-]
FS	= SERVICE FACTOR, TAB 00	[-]
D, L	= DIAMETER, LENGTH OF THE SHAFTS TO BE CONNECTED	[mm]
LA	= DISTANCE BETWEEN SHAFT ENDS	[mm]
Tn	= $\frac{P \times 30}{n \times \pi}$ = DRIVE NOMINAL TORQUE	[kNm]

VERIFY THAT:

COUPLING NOMINAL TORQUE	Tk [kNm]	$\geq Tn \times FS/Ki$
COUPLING MAX TORQUE	Tf [kNm]	$\geq Tn \times KS/Ki$
COUPLING MAX SPEED	nk [1/min]	$\geq n/Kv$
COUPLING MAX BORE	d [mm]	$\geq D$
Ki	= TORQUE REDUCTION FACTOR: pp. 02, 03, 04, 05	
Kv	= SPEED REDUCTION FACTOR: pp. 02, 03, 04, 05	

COUPLING
SELECTION

For a correct Service Factor **FS** it is necessary to know the following preliminary data:

- Type of Driving Machine
- Type of Driven Machine
- Duration and Type of the Daily Service
- Reversible Service Under Load
- Presence of Shocks or Very High Load Peaks
- Possibility of Operating Unit Shutdown

DENOMINATION EXAMPLE:
GO-A COUPLING SIZE 6 FOR
SHRINKFITTING AND OIL PRESSURE REMOVAL

GO-6A.W Coupling

NOTE: The max torques are calculated with a friction coefficient $\mu=0.12$, with the min and max interferences (in Micron) and a max hub stress equal to the 80% of the material yielding.

The max torque values vary linearly with the increasing of the hub length C and with the friction coefficient μ , which can be 0.15, 0.18 or 0.20 max.

TECHNICAL DATA

GO-A COUPLINGS

2 G1/8" grease nipples at 180°
on each sleeve

Removable side flanges design,
available on demand for sizes from 4 to 11
denomination example GO-6A.C

DENOMINATION EXAMPLE:
GO-B COUPLING SIZE 10 FOR
SHRINKFITTING AND OIL PRESSURE REMOVAL

GO-10B.W Coupling

NOTE: The max torques are calculated with a friction coefficient $\mu=0.12$, with the min and max interferences (in Micron) and a max hub stress equal to the 80% of the material yielding.

The max torque values vary linearly with the increasing of the hub length C and with the friction coefficient μ , which can be 0.15, 0.18 or 0.20 max.

SHRINKFITTING AND OIL PRESSURE REMOVAL
G20-30F.W Coupling

NOTE: The max torques are calculated with a friction coefficient $\mu=0.12$, with the min and max interferences (in Micron) and a max hub stress equal to the 80% of the material yielding.

The max torque values vary linearly with the increasing of the hub length C and with the friction coefficient μ , which can be 0.15, 0.18 or 0.20 max.

THESE INSTRUCTIONS ARE NECESSARY TO ENSURE A LONG LIFETIME OF OUR GEAR COUPLINGS

These general instructions are applicable to all our gear couplings. More specific and detailed instructions are provided with the goods. To perform all the required operations, use the necessary time and carefully check the work done. Please remember that all the mechanical machinings, like bore and keyway finishing, and the operations of lifting, handling, assembly, hub shrinkfitting, installation, alignment, lubrication and maintenance, must be performed by qualified, well trained and expert personnel only.

INSTALLATION

- 1 - Keep the gear couplings in a proper non-corrosive environment, protected from dust, humidity and bad weather. Every 6 months, repeat the anticorrosive protection treatment on the machined surfaces.
- 2 - Before use, remove the gear coupling from the package and check its condition.
- 3 - Before installation, disassemble the gear coupling in its main components, remove the anticorrosive coat from the machined surfaces and clean the bore surfaces carefully. If toxic chemicals are used for the cleaning operations, follow prescribed safety measures. NEVER USE CORROSIVE PRODUCTS.
- 4 - If the finish bore operations are to be performed, verify that they conform to the dimensional and geometrical tolerances, defined in the specifications and in the drawings (see also AGMA 9002-A26).
- 5 - When working next to a rotating device, always follow safety procedures: verify that the unit is off and that it cannot restart until the work is finished. Carefully check the safety conditions. The personnel must wear proper clothing, which cannot get caught on the mechanical components.
- 6 - In order to facilitate the handling and lifting of the gear couplings

and their components, screw the eyebolts in their bores, employing the required tools and operating in the max safety conditions. Before handling and lifting, verify the weights of the units and the position of their barycenter, checking with the catalogue and/or the drawings. During the handling operations, avoid any impact which may damage the machined components. Use procedures and handling and lifting devices which do not damage the gear couplings and their components.

- 7 - The gear couplings, when operating under load, offer a resistance to the axial slide (translation). An axial force proportional to the transmitted torque contrasts this movement, and its entity is directly related to the primitive diameter of the gear teeth and to the value of the dynamic friction coefficient.

The reaction force is obtained as follows:

Where: - F_a = Axial force [kN]

- T_n = Drive Nominal Torque [kNm]

- D_p = Primitive Diameter of the gear teeth [m]

- μ = Friction Coefficient (from 0.01 to 0.15), depending on the lubrication condition. In particular emergency conditions the value $\mu = 0.30$ can be taken.

$$F_a = T_n \times 2\mu / D_p$$

INSTALLATION, USE & MAINTENANCE

- 8- A slight interference of approx. the 0.5/1000 of the diameter is recommended for the hub key shrinkfitting operations. The following tolerances are suggested: H7 for the hole and m6-r6 for the shaft. Furthermore, after shrinkfitting, the keys must remain fixed in position on their flanks, using the tolerance P9 for the keyways. For standard keys in standard hubs, with the nominal load condition and heavy, unidirectional duty, it is preferable not to exceed a specific pressure on the flanks of 160 [N/mm²].
- 9- For keyless shrinkfittings, interferences from the 1/1000 to the 2.5/1000 of the diameter are employed, using a tolerance of H7 for the hole and s6-x6 for the shaft, or special fits. In this case always contact MAINA engineering staff who, in accordance with the type of shrinkfitting and the technical agreements, will evaluate the torque transmittable at the slipping as well as the stress generated in the hub, according to AGMA 9003-A91. In case of shrinkfittings with high interference on the flex hubs with working gear teeth, the external diameter of the gear teeth must always be reduced by a suitable dimension. The threaded holes, for fitting the oil pressure removal devices, and the shape of filling holes and grooves are usually executed in accordance with SKF prescriptions. Shrinkfittings can be cylindrical, cylindrical with double diameter, conical, conical with interposed bush. Conical shrinkfittings are suitable for hydraulic assembly.
- 10- Uniformly heat the hubs, placing them either in an air furnace or in an oil bath, both with thermostatic control. It is also possible to heat the hubs by open flame, taking care not to generate overheatings and frequently checking the temperature with suitable and precise devices. Employing the flame, heat the outer side of the hubs, carefully avoiding to direct it on the gear teeth; work in max safety condition, far from flammable materials or substances.
- 11- The heating temperatures must be evaluated considering an expansion which generates a clearance between hole and shaft of the $1 \div 1.5/1000$ of the diameter. The heating temperatures, depending on the shrinkfitting interference, are 110-130°C for key shrinkfittings and 180-250°C for keyless shrinkfittings. Never exceed 320°C.
- 12- After the hub heating, wearing suitable thermal insulated clothing, clear the hole seat of the carbon residual, using a proper cleaning paper instead of common rags. After cleaning, measure the entity of the expansions. Afterwards, lubricate holes and hub surfaces with pure mineral oil without additives. In case of shrinkfittings with a friction coefficient $\mu \geq 0.15$, follow our specifications (PFB 1202).
- 13- Before shrinkfitting the hub, check that the flanged sleeves or the removable side flanges are correctly positioned on the shafts. Verify the seal integrity of these components and check that the seals are correctly inserted in their seats.
- 14- During the shrinkfitting operations, avoid any contact between the hot hub surfaces and the rubber seals. Position the gear sleeves or the side flanges on the hubs only when the hub temperature goes below 60°C.
- 15- Position the machines to be connected so that the axial distance between the hubs (or between the heads of the shafts) complies and is in tolerance with the dimension A shown in the catalogue or on the drawings. Obviously, this dimension has to be in accordance with any possible expansion or axial movements/strokes of the connected shafts or to the axial clearance limiting devices. Moreover, to allow the half coupling additional alignment operations, the gear hubs must have the capability to move back so as to show a part of the hub; the minimum necessary movement is referred to as "cA" in TAB I. To make both the assembly and alignment operations and the additional gear teeth checks easier, it should be possible to move the gear sleeves back as far as they withdraw from the gear teeth. If there is not enough space, we recommend requesting gear couplings equipped with removable side flanges. To remove the gear couplings without moving the connected units, request couplings equipped with intermediate spacer.
- 16- Perform the angular and parallel alignment of the half couplings and of the connected machines. To assure long coupling gear teeth lifetime it is better to assure that, after the machines alignment operation and in dynamic working conditions, the initial residual misalignment between the two half couplings is very close to the 1/1000 of the coupling gear teeth distance φ . The max admissible limit is defined for every kind of gear couplings as the max dynamic angle value. This must always be lower than the allowed angle depending on the max working speed (see Kv diagrams). Secure the machines to their foundations and frames, tightening all the locking bolts and nuts. After this operation, check the half coupling alignment again.
- 17- Assemble the gear sleeves and the side flanges on the hubs, carefully avoiding any seal damage, then fill the half coupling with grease by a spatula.
- 18- Close the gear couplings, assembling all their components and devices. To assure a perfect fitting, apply a light coat of mastic on the flanges before closing them. During the assembly operations, respect the mutual position of the components; follow the assembly marks showing the right alignment and orientation of the hubs.
- 19- Screw the main flange connection bolts, carefully tightening them at the torques shown in TAB IV. Carefully screw and tighten all the remaining bolts.
- 20- For high-speed gear couplings dynamically balanced, in order to maintain the balancing condition with a reduced residual imbalance, besides observing the assembly marks used during the balancing operations, it is also recommended to respect the position of the bolts which, in this case, must not be replaced or mixed.
- 21- Complete the lubrication through the grease nipples or the conical plugs. Do not exceed 15÷20 bar of pressure. Verify that the floating part of the gear coupling (gear hubs and spacers) is able to move axially of the dimension H (see TAB 1).
- 22- Check the tightening of all bolts and screws, grease nipples and/or plugs.
- 23- Before starting the machines, place proper safety protections around the gear coupling.
- 24- After the start-up, the foundation settling and a suitable period of working at the max torques, speed and different temperatures (for a period of about 6 months), check the wear, verify and revise, if necessary, the alignment condition.

GEAR COUPLINGS ARE POTENTIALLY DANGEROUS DEVICES, WHEN ROTATING, AND MAY CAUSE INJURY OR DAMAGE, THEREFORE THEY MUST BE PROPERLY SHIELDED. SAFETY REGULATIONS PROVIDE THAT THE ROTATING PARTS OF THE MACHINES ARE PROTECTED BY FIXED SHIELDS. AVOID ANY UNINTENTIONAL CONTACT AND PROTECT FROM THE OBJECTS OR LUBRICANT SPATTERING. SHIELDS MUST BE MANUFACTURED BY THE USER ACCORDING TO APPLICABLE GOVERNMENT REGULATIONS.

INSTALLATION, USE & MAINTENANCE

CORRECT ALIGNMENT IS ESSENTIAL TO ENSURE A LONG OPERATING LIFETIME

The initial static no-load alignment condition (machines off) must consider what will happen under load (dynamic condition). This means that it should be also able to compensate the misalignments generated by load and temperatures (see point 16 of INSTALLATION INSTRUCTIONS).

Check the alignment condition of the half couplings, using for this purpose a modern laser equipment. In this case, to perform the alignment operations, the instructions for the use of the equipment have to be followed. Should you not have this equipment, use a thickness gauge or an inside micrometer with extension and a centesimal test indicator (with proper support elements). In this case, depending on the gear coupling type, proceed as indicated below.

Fig. 01

Fig. 02

Fig. 03

Fig. 04

Fig. 05

According to the parallelism and coaxiality values ΔA and ΔP verify the alignment as follows.

See TAB. I for the values of: distance between the gear mesh ϵ , hub diameter F , alignment length cA and hub axial slide H .

$$\Delta A = a2 - a1$$

$$\alpha T^\circ = \arctan \sqrt{(\tan \alpha A)^2 + (\tan \alpha P)^2}$$

$$\alpha T^\circ \leq \alpha D^\circ \text{ (Max Dynamic Angle)}$$

$$\alpha D^\circ = 0^\circ 10' - \text{Standard GO-A Couplings}$$

$$\alpha D^\circ = 0^\circ 15' - \text{GO-A Couplings with N.O. \& GO-A.HT}$$

$$\alpha D^\circ = 0^\circ 15' - \text{GO-B \& GO-B.HT Couplings}$$

$$\alpha D^\circ = 0^\circ 30' - \text{G20 Couplings}$$

PROPER LUBRICATION IS ESSENTIAL TO ENSURE A LONG OPERATING LIFETIME

- After the hub shrinkfitting and the positioning of the gear sleeves and side flanges, fill with grease all the spaces between hubs and sleeves using a spatula. After closing the gear coupling, apply a light coat of mastic on the flange connection surfaces.
- Tighten all the screws at the required torques (see TAB IV) then complete lubrication using all the grease nipples and/or plugs (2 for each half coupling).
- When lubricating through the grease nipples, verify that the grease is really filling the gear coupling; should the grease enter the coupling with difficulty, open a breather by removing a plug or a grease nipple.
- At the end of the lubrication, check that the gear coupling is completely filled with grease, then insert the plugs and/or the grease nipples checking their tightening.
- Regularly, every 3-4 months, relubricate the gear couplings. We suggest this initial time interval in case of integral seals, industrial applications, non corrosive environment, medium and heavy duty, room temperatures from 0 to 70°C. After the first working and observation year and after checking the results, time intervals can be extended up to 6 months. For different conditions, the time intervals between lubrications can still be extended, but they must never be longer than 12 months. When lubricating, totally replace grease. To let all the old grease out, remove a plug or a grease nipple at 180° from the new grease filling point and pump the new grease until this comes out from the breather. At the end of this operation, insert the plugs and/or grease nipples, checking that they are properly tightened.
- Always check that the floating part is axially free. If no movement is possible, open the gear coupling and check the gear teeth.
- Every 8000 working hours or maximum every two years, completely replace the grease. When doing this operation, you must open the gear coupling, clean the flange surfaces, remove the old grease, clean the interstices, check the gear teeth condition and then perform the operations shown in steps 1 to 4. Never use contaminated grease, or grease which is not suitable for the working conditions.

To separate the two flanges of the gear hubs never use tools which may damage the integrity of the seal surfaces.

To lubricate the gear couplings and their gear teeth, use lithium soap greases, with EP additives, centrifugation resistant, non hygroscopic and antioxidant, with minimum features comparable to what is shown in TAB II. Further details are contained in AGMA 9001-A86 instructions.

For all the conditions below, select the proper grease directly contacting the lubricant manufacturer and submit the chosen grease features to MAINA Technical Department for acceptance.

- Extreme duty condition
- Extreme working temperature
- Very heavy and/or reversible duty
- High humidity environment
- Extreme rotation speed
- "LONG-LIFE" lubrication

For information only, TAB III shows some brands and names of grease suitable to lubricate gear couplings operating in condition of medium speeds, loads and duties, and temperatures from -20 to +70°C.

TAB. II
LUBRICANT FEATURES

Working Temperature	ASTM Penetration Index	NLGI Grade
≥ -20°C ≤ 30°C	350 ÷ 380	0
≥ 30° C ≤ 70°C	300 ÷ 350	1
≤ -20°C	Please contact	
≥ 70°C	our technical department	

TAB. III
RECOMMENDED LUBRICANTS

AGIP	GR-MU EP	IP	ATHESIA EP
CHEVRON	DURA-LIGHT EP	MOBIL	MOBILETEMP 78
MONTESHELL	ALVANIA EP	ESSO	BEACON EP

NEVER MIX DIFFERENT KINDS AND/OR DIFFERENT BRANDS OF GREASE. THEY MAY BE INCOMPATIBLE AND MAY VOID THE LUBRICATION FEATURES OTHERWISE STATED, NEVER USE OIL TO LUBRICATE GEAR COUPLINGS.
